## A COMPREHENSIVE INSIGHT INTO THE FOUR-WHEELER ELECTRIC PASSENGER CAR MARKET

### A Comprehensive Insight into the Four-Wheeler Electric Passenger Car Market

The year 2019 witnessed the sale of 2.1 million four-wheeler electric passenger cars — a record that holds to date. On the global front, this was a 40% year-on increase, reflective of the fact that a shift from conventional vehicles to their electric counterparts was now on the cards.

No doubt, the COVID-19 pandemic slowed down the growth; however, that certainly doesn't entail prolonged market sluggishness. After all, the zero-emission policies would be even more profound in the coming days, and governments would be pushing towards renewable fuel economy standards.

To that end, let's explore the four-wheeler electric passenger car market and identify investment opportunities that might present themselves.

### What is the Market Size?

On a global basis, the four-wheeler electric passenger car market constituted a value of \$162.34 billion in 2019; however, it is estimated that the figure would rise to 802.81 billion in the next six years.

As it stands, the market is expected to grow at a CAGR of 23% between the forecast period. Some estimates about the market growth project the CAGR to be in excess of 27% until 2026, which does make sense considering the expectation of exponential market growth in the New Normal.

Due to a number of factors such as stricter emissions norms, rising government subsidies, and emission standards that mandate an average fuel consumption of less than a specific amount (may vary) g/km – more vehicles are likely to be sold in APAC and North America as compared to the rest of the world.

## AZODICARBONAMIDE (ADC)

Azodicarbonamide also known as '1,1'- azobisformamide on dry decomposition at 190°C yields a gas of about 60% N<sub>2</sub>, 35% CO and minor amounts of ammonia carbon and carbon dioxide. The gas yield is high 230-240 ml/g at standard temperature of pressure (CSTP). In 1978 largest volume of blowing agent 5000 metric tons produced in the U.S. was azodicarbonamide. Azodicarbonamide (ADA) also known as azobisformide (ABFA) is the most important organic chemical blowing agent for PVC as many desirable properties required in a good blowing agent and in addition is non-flammable plastics. It is used in the manufacture of PVC foam fabrics, floor coverings, low density open-cell foam, extruded low-density gaskets, wire and cable Jackets, slush molded products, cross cap-liners, injection moulded solids and high density profiles etc.

ABFA is also used as foaming agents for Ethylene-Vinyl acetate (EVA) plasters. Various grades of foaming agents of azodicarbonamide are available and are marketed in various trade names of grade, Viz ADC, Urea, Kempora, Celogen AZ, Cenitron AC, Profor ADC, Azoid, Polyzole-AZDN, Fisons Cenetron Ac/3 and A c/4 powder grades etc. chemically there exists only two variety Viz Technical and F.C.C. Technical variety ADA is used for formulating various grades of Azodicarbonamide for addition to plastics & Rubber as blowing agents and production of various cellular, Foamed products. F.C.C. grade is used as murturing agents for flours. Foaming agents for plastics are available in a wide range of formulations and types depending on the plastic involved processing temperatures, end users etc.

## CORN DRY MILLING PLANT

Maize/corn dry milling process is a less versatile, less capital intensive process that focuses primarily on the production of grain ethanol. In this process, the corn kernel are hammer milled into a medium to fine grind meal for introduction to the ethanol production process. The products of a traditional dry grind ethanol facility and dried distillers grain (DDG) a low value animal feed product.

Dry milling technology has been standardized by Central Food Technological Research Institute (CFTRI) Mysore. The grits is the main product of dry milling process, which is used as porridge by boiling domestically. The processing units, use grits for manufacture of products like ready to eat snacks (Corn flakes), manufacture of glucose by direct hydrolysis etc.

Maize is one of the staple foods in India. The annual maize production in India is around 21 million tons with the highest maize cultivation in Karnataka, Andhra Pradesh and Rajasthan.

India is one of the largest cultivators of maize in the world, and it is a crop suitable for all the growing seasons in nearly every agro-climatic zone within the country's borders. India has seen a dramatic increase in maize cultivation over the past few years, which explains its pre-eminence as a starch source among processors.

Traditionally, the grain is converted into flour in mill for making bread immature cobs are roasted and eaten all over the country. It is an important material for animal and poultry feed, corn flakes etc.

## LIQUID BROMINE

It is a deep red fuming liquid, member of the halogen elements as Group VII of the periodic table that is liquid at ordinary temperature and pressure. A rare element bromine is found in nature dispersed throughout the earth crust only in compounds such as soluble and insoluble bromides. The chief commercial source of bromine is ocean water from which the element is extracted by means of chemical replacement (oxidation) by more active chlorine. Bromine has traditionally been manufactured as a byproduct from saline mother liquors (bitterns) left after the crystallization of the main salt products.

The properties of bromine are significantly different from those of fluorine and chlorine. Discovered in the early 19th century, in the form of its salts (bromides) in the bitterns remaining after evaporating sea water and extracting the sodium chloride, it was obtained latter from stassfurt, Germany, as a byproduct in the production of potassium salts and from other deposits and salt lakes.

Its main use was originally for bromides in medicine still a minor use. Bromine first because of industrial importance with the development of modern photographic process, in which the light sensitive material is an emulsion of minute particles of silver bromide (together with silver chloride or iodide or both) in gelatin.

For a time, the expanding world automobile industry. Threatened a scarcity of bromine, obtained from brines, which contained about 0.5% bromine. To meet the demand, it was necessary to turn to sea water which contains about 70 ppm bromine.

## BRAKE PAD

Brakes are important parts of vehicles, machinery, and equipment used in transport, shipping, and other industries. The brakes have an assembly known as brake pad that consists of the brake lining. It also includes the brake backing. Thus, these two parts make the brake pad together. The brake lining is a type of surface in this assembly of brakes and it is used in heavy-duty vehicles and shipping industry. It is used in dry brakes. The Non asbestos brake lining material is ideal for use in the brake assembly systems in different industries. It helps in having an effective braking.

Brake pads are a component of disc brakes used in automotive and other applications. Brake pads are composed of steel backing plates with friction material bound to the surface that faces the disc brake rotors.

Brake Pads are a very important part of Brake System, every time we brake; it is the pad which rubs against the rotating rotor to give the braking force for stopping the vehicle. As Brake Pads wear out with every braking they are one of the fastest moving replacement parts for vehicles.

Brake pads are a component of disc brakes used in automotive and other applications. Brake pads are steel backing plates with friction material bound to the surface that faces the disk brake rotor.

## MUSTARD COOKING OIL

Indian Edible Oil Industry Vegetable oil and oil seeds are two of the essential commodities for the consumer's daily needs. India is one of the largest producers of oilseeds in the world with an area of 26.54 million hectares under cultivation producing 23-28 million tonnes of oil seeds every year depending on the monsoons. It produces nine types of oil seeds namely, Groundnut, Soybean, Rape/Mustard seed, Sunflower seed, Sesame seed, Castor seed, Niger seed, Safflower seed, Linseed. It also enjoys the position of being the third largest consumer of edible oil in the world next only to US and China owing to its growing population, rising income levels and changing eating habits.

The per capita consumption has grown by 8.1 per cent over the last five years. It stood at 12.5 kg/person per annum which is considerably low as compared to the world average of 17.5 kg/annum. Developed countries like Japan, Brazil and USA consume around 20.8 kg/annum, 21.3 kg/annum and 48.0 kg/annum respectively. The imports mainly comprise Palm oil, Soybean oil and Sunflower oil. Indonesia, Argentina and Malaysia are the key exporters of oil to India. Olive oil is mainly imported from European countries like Italy and Spain. Rapeseed oil is imported from UAE.

While mustard seeds are abundantly produced in most parts of India, its milling/grinding is mostly done by the large centralized plants, which have the advantage of high efficiency and reduced costs due to economies of scale. Despite the clear advantage of large plants, the importance of tiny decentralized oil extraction units cannot be discounted as they also prove to be economic and present opportunities for self-employment in situations:

where oil produced by large plants do not find its way to remote and distant places because of high transportation costs involved in wider distribution and in places where there is no oil expeller in the area and the farmers sell oil seeds to large refineries which they then buy back at high cost in the form of cooking oil but without the valuable high protein oil cake.

Therefore, in recognition of the existing opportunities of setting-up mustard oil expeller units in such situations, tiny units are suggested for the first generation Tribal entrepreneurs – the investment for which is modest and the operation is simple.

The unit is required to maintain a minimum stock of seed and enough to continue operations throughout the year. Hence, the location of the unit has to be essentially in those areas where the raw material is locally available in abundance.

In general, more profit could be made if the cooking oil is packed into retail size bottles.

However, considering the difficulty in obtaining glass or plastic bottles in large quantities in remote areas and blocking thereby substantial capital, the possibility of using second-hand bottles may be utilised. Alternatively, oil could be sold in drums to the provision stores in neighboring towns/cities.

The viability of any oil extraction unit considerably depends on the sale of the oil cake, which is extensively used as animal feed and other sub-products.

## FEED PLANT

India possesses an enormous cattle (180 million) and buffalo (61 million) population but the annual milk production has reached only about 30 million tons. The low milk production is primarily due to the poor potential of the animal and the lack of adequate nutrition. For the fullest exploitation of their genetic potentialities, better feeding must go hand in hand with better breeding.

The principal feed resources for animal consumption in the country are crop residues like straws of wheat, rice and other cereals and stoves which are very poor in feed value. Even these are in short supply. These are supplemented to some extent by relatively better quality fodders like cultivated leguminous and non leguminous fodder grasses and concentrates. The latter are formulated largely from agro-industrial by-product and forest wastes and small quantities of low-grade cereals with the present stock of feed and fodder resources available in the country, it is well impossible to meet the nutrient requirements of even the present day low-producing cattle and buffaloes such a situation is bound to aggravate difficulties in the feeding of better producing livestock such as cross bred lows in exploiting their full genetic potentiality for early growth, better reproduction and higher milk production.

Livestock in the country, therefore, suffer widely from insufficient supply of nutrients. The unconventional agro-industrial by products and forest wastes may find a greater use as livestock feeds in coming years

The nutritive value of tropical feeds and fodder is lower than those grown in temperate region.

## BRUSHLESS DC FAN

The global BLDC fan market is flourishing on the rear of increasing demand for cooling systems across varied user applications, including the growing need amongst user industries for advanced technological products that are more efficient and effective and consume less energy. The brushless motors that are attached to the fan blade have several benefits over conventional motors, like high speed, high power-to-weight ratio, low maintenance and electronic control. Further, brushless motors are smaller in size as compared to a standard motor. Hence, BLDC fans are widely utilized in computer peripherals, vehicles, aircrafts, hand-held power tools and other sophisticated applications. Moreover, increasing trade on fans round the world is additionally anticipated to market significantly towards the expansion of the worldwide BLDC market.

Brushless DC fans are usually available at three nominal voltages: 12V, 24V and 48V. If the system has regulated power supply in one of these, then a brushless DC fan may be selected which will give the exact performance required, regardless of the AC input variables which plague AC fans.

Because the speed and airflow of a typical DC fan is proportional to the voltage supplied, a single product may be used to meet different applications by setting the supply voltage to what will give the desired airflow DC Fan describes that result of varying the DC voltage supplied to a given fan. If, for example, a fan supplies 110 CFM of air at free delivery, 28V may yield 127 CFM, should that be needed. On the other hand, 24V operation may provide too much flow; the supply voltage might then be reduced to a level that yields the desired airflow.

The voltage range that may be applied to the fan to assure satisfactory operation is dependent upon the individual fan design and may be as small as 10-14V for 12V units and up to 12-56V for 48V units.

A toy is an item that is used in play, especially one designed for such use. Playing with toys can be an enjoyable means of training young children for life in society. Different materials like wood, clay, paper, and plastic are used to make toys. Many items are designed to serve as toys, but goods produced for other purposes can also be used. For instance, a small child may fold an ordinary piece of paper into an airplane shape and "fly it". Newer forms of toys include interactive digital entertainment. Some toys are produced primarily as collectors' items and are intended for display only.

The origin of toys is prehistoric; dolls representing infants, animals, and soldiers, as well as representations of tools used by adults are readily found at archaeological sites. The origin of the word "toy" is unknown, but it is believed that it was first used in the 14th century. Toys are mainly made for children. The oldest known doll toy is thought to be 4,000 years old.

Playing with toys is considered to be important when it comes to growing up and learning about the world around us. Younger children use toys to discover their identity, help their bodies grow strong, learn cause and effect, explore relationships, and practice skills they will need as adults. Adults on occasion use toys to form and strengthen social bonds, teach, help in therapy, and to remember and reinforce lessons from their youth.

India's urban population is the second largest in the world—larger than the combined urban populations of all countries except China, the US and Russia. India has more than 800 Indian toys and games manufacturers, suppliers and exporters, most of who hail from the unorganized sector.
